1 From Riemann to Lebesgue

§1.1 Riemann Integral

Definition 1.1.1. $P = \{a = x_0 < x_1 < \cdots < x_n = b\}$ is a partition of $[a, b]$.

Definition 1.1.2. If P, P' are partitions of $[a, b]$ and $P \subseteq P'$, then P' is a refinement of P .

Definition 1.1.3. Given a bounded function $f : [a, b] \rightarrow \mathbb{R}$ and a partition $P = \{a = x_0 < x_1 < \cdots < x_n = b\}$ we define

$$m_i(f) = \inf_{t \in [x_{i-1}, x_i]} f(t)$$

$$M_i(f) = \sup_{t \in [x_{i-1}, x_i]} f(t)$$

define the lower sum as

$$L(f, P) = \sum_{i=1}^n m_i(f)(x_i - x_{i-1})$$

and the upper sum as

$$U(f, P) = \sum_{i=1}^n M_i(f)(x_i - x_{i-1})$$

Lemma 1.1.4

Given a bounded function $f : [a, b] \rightarrow \mathbb{R}$ and partitions P of $[a, b]$. Suppose that P' is a refinement of P then

$$(b - a) \inf_{t \in [a, b]} f(t) \leq L(f, P) \leq L(f, P') \leq U(f, P') \leq U(f, P) \leq (b - a) \sup_{t \in [a, b]} f(t)$$

Corollary 1.1.5

Suppose that P_1, P_2 are partitions of $[a, b]$ then $L(f, P_1) \leq U(f, P_2)$

Proof. Let $P' = P_1 \cup P_2$ then P' is a refinement of P_1 and P_2 and use Lemma 1.1.4 \square

Lemma 1.1.6

Suppose that $f : [a, b] \rightarrow \mathbb{R}$ is bounded. Then

$$(b - a) \inf_{t \in [a, b]} f(t) \leq \sup_P L(f, P) \leq \inf_P U(f, P) \leq (b - a) \sup_{t \in [a, b]} f(t)$$

Definition 1.1.7. A function $f : [a, b] \rightarrow \mathbb{R}$ is Riemann integrable if

$$\sup_P L(f, P) = \inf_P U(f, P)$$

and the common value is called the Riemann integral of f and is denoted by $\int_a^b f$

Lemma 1.1.8

Suppose that $f : [a, b] \rightarrow \mathbb{R}$ is bounded. Then f is Riemann integrable if and only if for any $\varepsilon > 0$ there exists a partition P such that

$$U(f, P) - L(f, P) < \varepsilon$$

Proof. (\Rightarrow) For any $\varepsilon > 0$. Suppose that f is Riemann integrable. Then there exists P_1, P_2 such that

$$L(f, P_1) \geq \int_a^b f - \frac{\varepsilon}{2}$$

$$U(f, P_2) \leq \int_a^b f + \frac{\varepsilon}{2}$$

let $P = P_1 \cup P_2$ then

$$U(f, P) - L(f, P) \leq \varepsilon$$

(\Leftarrow) For any $\varepsilon > 0$, there exists P_ε such that

$$U(f, P_\varepsilon) - L(f, P_\varepsilon) < \varepsilon$$

since ε is arbitrary, we have

$$\sup_P L(f, P) = \inf_P U(f, P)$$

□

Theorem 1.1.9

If $f : [a, b] \rightarrow \mathbb{R}$ is continuous on $[a, b]$ then f is Riemann integrable.

Proof. f is continuous on a compact set, so, f is uniformly continuous. For any $\varepsilon > 0$, there exists $\delta > 0$ such that for any $x, y \in [a, b]$ if $|x - y| < \delta$ then $|f(x) - f(y)| < \frac{\varepsilon}{(b-a)}$. Let N be such that $\frac{(b-a)}{N} < \delta$ and let $P = \{x_i := a + \frac{(b-a)i}{N}\}$ then

$$\begin{aligned} U(f, P) - L(f, P) &= \sum_{i=1}^N (M_i(f) - m_i(f)) \frac{(b-a)}{N} \\ &\leq \sum_{i=1}^N \frac{\varepsilon}{(b-a)} \frac{(b-a)}{N} \\ &= \varepsilon \end{aligned}$$

□

Remark 1.1.10. Let $f(x) = \mathbb{1}_{\mathbb{Q}}(x)$ defined on the $[0, 1]$. Then $U(f, P) = 1$ and $L(f, P) = 0$ for any partition P . So, f is not Riemann integrable.

§1.2 Lebesgue null sets

Definition 1.2.1. For the closed interval $I = [a, b]$, the length of I , denoted as $\ell(I)$ is defined as $\ell(I) = b - a$

Definition 1.2.2. A set E is said to be a Lebesgue null set if for any $\varepsilon > 0$ there exists a sequence of intervals $\{I_n\}_{n \in \mathbb{N}}$ such that

$$E \subseteq \bigcup_{n=1}^{\infty} I_n$$

and

$$\sum_{n=1}^{\infty} \ell(I_n) < \varepsilon$$

Lemma 1.2.3

Countable unions of Lebesgue null sets are Lebesgue null sets.

Proof. For any $\varepsilon > 0$ and for each Lebesgue null sets E_n there exists $I_{E_n, i}$ such that

$$E_n \subseteq \bigcup_{i=1}^{\infty} I_{E_n, i}$$

and

$$\sum_{i=1}^{\infty} \ell(I_{E_n,i}) < \frac{\varepsilon}{2^n}$$

then

$$\sum_{n=1}^{\infty} \sum_{i=1}^{\infty} \ell(I_{E_n,i}) < \varepsilon$$

□

Definition 1.2.4. A set $E \subseteq [a, b]$ has content zero if for any $\varepsilon > 0$ there exists I_1, I_2, \dots, I_n such that

$$E \subseteq \bigcup_{i=1}^n I_i$$

and

$$\sum_{i=1}^n \ell(I_i) < \varepsilon$$

Lemma 1.2.5

Suppose that $E \subseteq [a, b]$ is a compact Lebesgue null set then E has content zero.

Proof. For any $\varepsilon > 0$ there exists a sequence of interval $\{I_n\}_{n \in \mathbb{N}}$ such that $E \subseteq \bigcup I_n$ and $\sum \ell(I_n) < \frac{\varepsilon}{2}$. Suppose that $I_n = [a_n, b_n]$, then let

$$J_n = \left(a_n - \frac{\varepsilon}{2^{n+3}}, b_n + \frac{\varepsilon}{2^{n+3}} \right) \supseteq I_n$$

then from the compactness of E , there exists a finite subcover $J_{n_1}, J_{n_2}, \dots, J_{n_k}$ such that $E \subseteq \bigcup J_{n_i}$ then we construct a finite closed interval K_i by

$$K_i = \left[a_{n_i} - \frac{\varepsilon}{2^{n_i+2}}, b_{n_i} + \frac{\varepsilon}{2^{n_i+2}} \right]$$

then $E \subseteq \bigcup K_i$ and $\sum \ell(K_i) < \varepsilon$

□

Corollary 1.2.6

if $a < b$ then $[a, b]$ is not a Lebesgue null set.

Proof. By contradiction, since $[a, b]$ is compact, then $[a, b]$ has content zero, but $[a, b]$ don't have content zero. □

§1.3 Oscillation and Discontinuity

Definition 1.3.1. Suppose that $X \subseteq \mathbb{R}$, $f : X \rightarrow \mathbb{R}$ for any $x \in X$ and $\delta > 0$, define

$$M_{f,\delta}(x) := \sup\{f(y) : d(x, y) < \delta\}$$

$$m_{f,\delta}(x) := \inf\{f(y) : d(x, y) < \delta\}$$

then we define

$$\text{osc}_f(x) := \lim_{\delta \rightarrow 0^+} M_{f,\delta}(x) - m_{f,\delta}(x)$$

Lemma 1.3.2

f is continuous at x if and only if $\text{osc}_f(x) = 0$.

Proof. (\Rightarrow) Suppose that f is continuous at x , then for any $\varepsilon > 0$ there exists $\delta > 0$ such that if $d(x, y) < \delta$ then $|f(x) - f(y)| < \frac{\varepsilon}{2}$. Then

$$M_{f,\delta}(x) - m_{f,\delta}(x) \leq \sup\{f(y) : d(x, y) < \delta\} - \inf\{f(y) : d(x, y) < \delta\} < \varepsilon$$

(\Leftarrow) Suppose that $\text{osc}_f(x) = 0$, then for any $\varepsilon > 0$ there exists $\delta > 0$ such that $M_{f,\delta}(x) - m_{f,\delta}(x) < \varepsilon$. Then for any $y \in X$ such that $d(x, y) < \delta$, we have $|f(x) - f(y)| < \varepsilon$ then f is continuous at x . \square

Before we prove this theorem, we need to prove the following lemma.

Lemma 1.3.3

$\{x \in [a, b] : \text{osc}_f(x) \geq \gamma\}$ is closed.

Proof. We need to show that $\{x : \text{osc}_f(x) < \gamma\}$ is open. Fix x in that set. Let $\varepsilon = \gamma - \text{osc}_f(x)$ then

$$\sup_{|w-x|<\delta} f(w) - \inf_{|w-x|<\delta} f(w) < \text{osc}_f(x) < \gamma$$

then for any $w \in (x - \delta, x + \delta)$ if $|w - x| < \frac{\delta}{2}$ then

$$\text{osc}(w) \leq \sup_{|y-w|<\frac{\delta}{2}} f(y) - \inf_{|y-w|<\frac{\delta}{2}} f(y) < \gamma$$

So, $B(x, \frac{\delta}{2}) \subseteq \{x : \text{osc}_f(x) < \gamma\}$ \square

we observe that

- (i) If the set of discontinuities is a Lebesgue null set, then $\{x : \text{osc}_f(x) \geq \gamma\}$ is a set of content zero.
- (ii) If $\{x : \text{osc}_f(x) \geq \gamma\}$ is a Lebesgue null set, then the set of discontinuities is also a Lebesgue null set.

Lemma 1.3.4

Suppose that f is defined on $[c, d]$, assume that $\text{osc}_f(x) < \gamma$ then we can find a partition

$$U(f, P) - L(f, P) < \gamma(b - a)$$

Proof. For every $x \in [c, d]$, there exists $\delta_x > 0$ such that

$$\sup_{|w-x|<\delta_x} f(w) - \inf_{|w-x|<\delta_x} f(x) < \gamma$$

construct a cover by

$$B(x, \delta_x) = \{w \in [c, d] : |w - x| < \delta_x\}$$

since $[c, d]$ is compact, there exists a finite subcover $B(p_1, \delta_{p_1}), \dots, B(p_n, \delta_{p_n})$ then let $\delta_0 = \frac{\min\{\delta_{p_i}\}}{100}$ then we can construct a partition $P = \{c = x_0 < x_1 < \dots < x_n = d\}$ such that $|x_i - x_{i-1}| < \delta_0$ then $M_i - m_i < \gamma$ and

$$\begin{aligned} U(f, P) - L(f, P) &= \sum_{i=1}^n (M_i - m_i)(x_i - x_{i-1}) \\ &< \gamma \sum_{i=1}^n (x_i - x_{i-1}) \\ &= \gamma(d - c) \end{aligned}$$

□

Theorem 1.3.5

Suppose that $f : [a, b] \rightarrow \mathbb{R}$ then $f \in \mathcal{R}([a, b])$ if and only if f is bounded and the set of discontinuity of f is a Lebesgue null set.

Proof. (\Rightarrow) We want to show that for every $n \in \mathbb{N}$,

$$\mathcal{D}_n = \left\{ x : \text{osc}_f(x) \geq \frac{1}{n} \right\}$$

is a Lebesgue null set. For any $\varepsilon > 0$, since f is Riemann integrable, there exists a partition P of $[a, b]$ such that

$$U(f, P) - L(f, P) = \sum_{i=1}^n (x_i - x_{i-1})(M_i - m_i) \leq \frac{\varepsilon}{n}$$

where $M_i = \sup_{x \in [x_{i-1}, x_i]} f(x)$ and $m_i = \inf_{x \in [x_{i-1}, x_i]} f(x)$. in particular

$$\begin{aligned} \sum_{[x_{i-1}, x_i] \cap \mathcal{D}_n \neq \emptyset} (x_i - x_{i-1})(M_i - m_i) &\leq \frac{\varepsilon}{n} \\ \frac{1}{n} \sum_{[x_{i-1}, x_i] \cap \mathcal{D}_n \neq \emptyset} \ell([x_{i-1}, x_i]) &\leq \frac{\varepsilon}{n} \end{aligned}$$

So, this interval cover the set \mathcal{D}_n

(\Leftarrow) pick $\varepsilon_1 \ll \varepsilon$, consider the set $D(\varepsilon_1) = \{x \in [a, b] : \text{osc}_f(x) \geq \varepsilon_1\}$ closed set. Since $D(\varepsilon_1)$ is a Lebesgue null set from the Lemma 1.2.5 it has content zero so we can find I_1, \dots, I_n such that

$$\sum_{j=1}^n \ell(I_j) < \varepsilon_1 \text{ and } D(\varepsilon_1) \subseteq \bigcup_{j=1}^n I_j$$

We form a partition of $[a, b]$, $a = x_0 < x_1 < \dots < x_N = b$ from I_j . There are two cases that we need to consider

- 1) if $[x_{i-1}, x_i] \subseteq I_j$ for some j then set $P_i = [x_{i-1}, x_i]$
- 2) if $[x_{i-1}, x_i] \cap I_j = \emptyset$ for all j then $\text{osc}(x) < \varepsilon_1$ for all $x \in [x_{i-1}, x_i]$. We want to partition further the interval $[x_{i-1}, x_i]$ by partition P_i . Using Lemma 1.3.4 we can find a partition P_i of $[x_{i-1}, x_i]$ such that

$$U(f, P_i) - L(f, P_i) < \varepsilon_1(x_i - x_{i-1})$$

We form a partition $P = P_1 \cup \dots \cup P_N$ then

$$\begin{aligned} U(f, P) - L(f, P) &= \sum_{i=1}^N (U(f, P_i) - L(f, P_i)) \\ &= \sum_{i:\text{case 1}} (U(f, P_i) - L(f, P_i)) + \sum_{i:\text{case 2}} (U(f, P_i) - L(f, P_i)) \\ &\leq 2M \sum_{i:\text{case 1}} (x_i - x_{i-1}) + \varepsilon_1 \sum_{i:\text{case 2}} (x_i - x_{i-1}) \\ &\leq 2M\varepsilon_1 + \varepsilon_1(b - a) \\ &= \varepsilon_1(2M + b - a) \end{aligned}$$

□

2 Measures

§2.1 Introduction

We define the $\ell([c, d]) = d - c$ and If $E = [c_1, d_1] \cup [c_2, d_2]$ where $d_1 < c_2$ then $\ell(E) = d_1 - c_1 + d_2 - c_2$. This is consistent with the definition

$$\ell(E) = \int \mathbb{1}_E(x) \, dx$$

where the integral denotes the Riemann integral.

if $E \subseteq [a, b]$ reference interval is

$$\int_a^b \mathbb{1}_E \, dx$$

Remark 2.1.1. The consistency of the definition also works with the set (c, d) , $[c, d)$, and $(c, d]$, where the length of all of them is $d - c$.

Remark 2.1.2. we denote $\mathbb{1}_E$ to be

$$\mathbb{1}_E(x) = \begin{cases} 1 & \text{if } x \in E \\ 0 & \text{if } x \notin E \end{cases}$$

Example 2.1.3

Let $f(x) = \mathbb{1}_{\mathbb{Q}}(x)$ defined on the $[0, 1]$. Then $U(f, P) = 1$ and $L(f, P) = 0$ for any partition P .

Fix the reference interval $[a, b]$ and consider subset of $[a, b]$

Let \mathcal{A} = collection of sets for which $\int_{[a, b]} \mathbb{1}_E \, dx$ exists.

If $A_1, \dots, A_n \in \mathcal{A}$, we can make the set to be mutually disjoint by taking $E_1 = A_1$, $E_2 = A_2 \setminus A_1$, $E_3 = A_3 \setminus (A_1 \cup A_2)$, and so on.

Example 2.1.4

For $E_1, E_2 \in \mathcal{A}$, we have

$$\mathbb{1}_{E_1 \cap E_2}(x) = \mathbb{1}_{E_1}(x) \mathbb{1}_{E_2}(x)$$

Example 2.1.5

For the Riemann integral, we have

$$\int_a^b f(y) = \int_{a-v}^{b-v} f(v+y)$$

and we want

$$\int \mathbb{1}_E(x) \, dx = \int \mathbb{1}_{v+E}$$

where $v + E = \{v + x : x \in E\}$

Let $E = \mathbb{Q} \cap [0, 1]$ countable set, we can enumerate r_1, r_2, r_3, \dots such that

$$E = \bigcup_{n=1}^{\infty} \{r_n\}$$

and

$$\int \mathbb{1}_{\{r_k\}} = 0$$

E should have length zero but according $\mathbb{1}_E$ is not Riemann integrable.

§2.2 Construction of Measure

Suppose that \mathcal{C} be a collection of sets.

Can we define on suitable large collection of subset of \mathbb{R} ?

a set function $\mu : \mathcal{C} \rightarrow [0, \infty]$ such that if $\{E_j\}_{j=1}^{\infty}$ is a sequence of disjoint set in \mathcal{C} then

$$\mu\left(\bigcup_{j=1}^{\infty} E_j\right) = \sum_{j=1}^{\infty} \mu(E_j)$$

$$\mu([a, b]) = b - a, \mu([0, 1)) = 1$$

Can we do this for the collection of all subset of \mathbb{R} ?

Answer: No, Vitali set.

Theorem 2.2.1

We cannot define a measure on the collection of all subset of \mathbb{R} . i.e., there does not exist a set function $\mu : \mathfrak{P}(\mathbb{R}) \rightarrow [0, \infty]$ such that

- (i) $\mu(v + E) = \mu(E)$ for all $E \subseteq \mathbb{R}$ and $v \in \mathbb{R}$
- (ii) $\mu([0, 1]) = 1$
- (iii) $\mu\left(\bigcup_{j=1}^{\infty} A_j\right) = \sum_{j=1}^{\infty} \mu(A_j)$ for all disjoint $A_j \subseteq \mathbb{R}$

Before we prove that theorem, we need to define something and prove the following lemma.

Definition 2.2.2. We define a Vitali set V from picking an element $x \in [0, 1)$ from each equivalence class of the relation $x \sim y$ if $x - y \in \mathbb{Q}$. (e.g, pick $x \in O_x$ for $O_x \in \mathbb{R}/\mathbb{Q}$)

Lemma 2.2.3

Suppose that V is a Vitali set then

$$V \cap V + q = \emptyset$$

For all $q \in \mathbb{Q} \setminus \{0\}$

Proof. Suppose not, there exists $a \in V$ such that $a \in V + q \implies a - q \in V$ but we only pick 1 element in each equivalence class. contradiction. \square

Lemma 2.2.4

Let V be a Vitali set and let $W = \{q \in [-1, 1] : q \in \mathbb{Q}\}$ and

$$E = \bigcup_{w \in W} V + w$$

then

$$[0, 1] \subseteq E \subseteq [-1, 2]$$

Proof. Consider $E \subseteq [-1, 2]$. Since $V \subseteq [0, 1)$, then for any $v \in V$, $v \in [0, 1) \implies v + w \in [-1, 2]$.

For the $[0, 1] \subseteq E$, for any $x \in [0, 1]$ there exists $O_x \in \mathbb{R}/\mathbb{Q}$ such that $x \in O_x$. then there exists $v \in C_x$ such that $v \in [0, 1)$ and $v \in V$, since both are from the same equivalence

class, then $x - v \in \mathbb{Q}$ and $|x - v| < 1 \implies x - v \in (-1, 1)$. Hence, there exists $w \in W$ such that $w = x - v$ so $v + w = x$. \square

Proof of the theorem. Suppose that μ exists then using the result from Lemma 2.2.4 we get that

$$\mu([0, 1]) \leq \mu(E) \leq \mu([-1, 2])$$

from Lemma 2.2.3 we know that each $V + w$ is disjoint, so

$$\begin{aligned} \mu([0, 1]) &\leq \sum_{w \in W} \mu(V) \leq \mu([-1, 2]) \\ 1 &\leq \sum_{w \in W} \mu(V) \leq 3 \end{aligned}$$

if $\mu(V) = 0$ then $\mu(E) = 0$ and if $\mu(V) > 0$ then $\mu(E) = \infty$. Both are contradiction. \square

§2.3 σ -algebra

Definition 2.3.1. Given a reference X . An **algebra** is a collection of subsets of X , \mathcal{A} , such that

- (i) $X \in \mathcal{A}$
- (ii) If $A \in \mathcal{A}$ then the complement $A^c = X \setminus A \in \mathcal{A}$
- (iii) If $A, B \in \mathcal{A}$ then $A \cup B \in \mathcal{A}$

Remark 2.3.2. • $\emptyset \in \mathcal{A}$ because $\emptyset = X^c$

- $A_1, A_2 \in \mathcal{A}$, $A_1 \setminus A_2 = A_1 \cap A_2^c \in \mathcal{A}$
- Observe that if $A_1, A_2 \in \mathcal{A}$ then $A_1 \cap A_2 \in \mathcal{A}$ because $(A_1 \cap A_2)^c = A_1^c \cup A_2^c$

Example 2.3.3

$X = [a, b]$ and \mathcal{A} is the collection of all sets $E \subseteq [a, b]$ such that the Riemann integral $\int \mathbb{1}_E(t) dt$ exists

Definition 2.3.4. A σ -algebra \mathcal{M} on X is

- (i) an algebra of subsets of X
- (ii) If A_1, A_2, A_3, \dots is a sequence of set in \mathcal{M} then

$$\bigcup_{j=1}^{\infty} A_j \in \mathcal{M}$$

(X, \mathcal{M}) is called a “**measurable space**”.

Remark 2.3.5. \mathcal{M} is a σ -algebra on X then it satisfies

- (i) $X \in \mathcal{M}$
- (ii) If $A \in \mathcal{M}$ then $A^c \in \mathcal{M}$
- (iii) countable union of sets in \mathcal{M} is in \mathcal{M}

Definition 2.3.6. Let (X, \mathcal{M}) be a measurable set. Then a measure μ is a set function $\mu : \mathcal{M} \rightarrow [0, \infty], E \mapsto \mu(E)$ such that

- (i) $\mu(\emptyset) = 0$
- (ii) If E_1, E_2, E_3, \dots is a sequence of disjoint set in \mathcal{M} then

$$\mu \left(\bigcup_{j=1}^{\infty} E_j \right) = \sum_{j=1}^{\infty} \mu(E_j)$$

called σ -additivity.

(X, \mathcal{M}, μ) is called a “**measure space**”.

Remark 2.3.7.

$$\left(\bigcap_{j=1}^{\infty} A_j \right) = \left(\bigcup_{j=1}^{\infty} A_j^c \right)^c \in \mathcal{M}$$

Example 2.3.8

examples of σ -algebra

- (i) $\mathcal{M} = \{\emptyset, X\}$
- (ii) $\mathcal{M} = \mathfrak{P}(X) =$ collection of all subsets of X
 $\mathbb{N} = \{1, 2, 3, \dots\}$ and $\mu(E) = |E|$ (the cardinality of E) if E is finite and $\mu(E) = \infty$ if E is infinite.
- (iii) X write X as a disjoint (countable) union of sets A_j . Then $\mathcal{M} =$ all countable unions of A_j .
- (iv) Let X be a set. Let \mathcal{M} be the collection of all sets $A, A \subseteq X$ such that A is countable or A^c is countable.
- (v) $X = \mathbb{R}$ (or \mathbb{R}^n), $\mathcal{B}_{\mathbb{R}}$ is the smallest σ -algebra containing all open sets.

More generally if \mathcal{E} is a collection of subsets of X then $\mathfrak{M}(\mathcal{E})$ is the smallest σ -algebra that contains all sets in \mathcal{E} .

If $\mathcal{M}_1, \mathcal{M}_2$ are two σ -algebras, then $\mathcal{M}_1 \cap \mathcal{M}_2$ is also a σ -algebra.

If $\{\mathcal{M}_\alpha\}_{\alpha \in \mathcal{I}}$ is a collection of σ -algebras, their intersection is also a σ -algebra.

Generating σ -algebra

Definition 2.3.9. $\mathfrak{M}(\mathcal{E}) :=$ intersection of all σ -algebra that contain the collection \mathcal{E} . We call it the σ -algebra generated by \mathcal{E} .

Remark 2.3.10. If $\mathcal{E} \subset \mathcal{F} \implies \mathfrak{M}(\mathcal{E}) \subset \mathfrak{M}(\mathcal{F})$

Lemma 2.3.11

If $\mathcal{E} \subseteq \mathfrak{M}(\mathcal{F})$ then $\mathfrak{M}(\mathcal{E}) \subseteq \mathfrak{M}(\mathcal{F})$

Proof. $\mathfrak{M}(\mathcal{F})$ is a σ -algebra that contains \mathcal{E} . It contains the intersection of all σ -algebras which contain \mathcal{E} . \square

Example 2.3.12

$\mathcal{B}_{\mathbb{R}} = \sigma$ -algebra on \mathbb{R} containing all open sets \mathcal{E} a collection of all open intervals, $\mathcal{E} \subseteq \mathcal{O} =$ collection of all open sets in \mathbb{R} , $\mathcal{B}_{\mathbb{R}} = \mathfrak{M}(\mathcal{O})$. $\mathfrak{M}(\mathcal{E}) \subseteq \mathcal{B}_{\mathbb{R}}$. Each open set is a countable union of open intervals. Each open set is contained in $\mathfrak{M}(\mathcal{E})$.

Since $\mathcal{O} \subseteq \mathfrak{M}(\mathcal{E}) \implies \mathfrak{M}(\mathcal{O}) \subseteq \mathfrak{M}(\mathcal{E})$. get $\mathfrak{M}(\mathcal{O}) = \mathfrak{M}(\mathcal{E})$.

Definition 2.3.13. Given $(X_1, \mathcal{M}_1), (X_2, \mathcal{M}_2), \dots, (X_n, \mathcal{M}_n)$ measurable spaces. Define a “product σ -algebra” on $X_1 \times X_2 \times \dots \times X_n$ denoted by

$$\mathcal{M}_1 \oplus \mathcal{M}_2 \oplus \dots \oplus \mathcal{M}_n = \bigoplus_{j=1}^n \mathcal{M}_j$$

defined as the σ -algebra generated by the sets $E_1 \times E_2 \times \dots \times E_n$ where $E_j \in \mathcal{M}_j$.

i.e., define $\mathcal{E} := \{E_1 \times E_2 \times \dots \times E_n : E_j \in \mathcal{M}_j\}$ then

$$\bigoplus_{j=1}^n \mathcal{M}_j := \mathfrak{M}(\mathcal{E})$$

Remark 2.3.14. Folland defines it the σ -algebra generated by

$$(X_1 \times X_2 \times \cdots \times X_{n-1} \times E_n)$$

where $E_n \in \mathcal{M}_n$,

$$(X_1 \times X_2 \times \cdots \times E_{n-1} \times X_n)$$

where $E_{n-1} \in \mathcal{M}_{n-1}$. and so on. To be clear, let

$$\mathcal{E}' := \bigcup_{j=1}^n \{(X_1 \times \cdots \times X_{j-1} \times E_j \times X_{j+1} \times \cdots \times X_n) : E_j \in \mathcal{M}_j\}$$

then

$$\bigoplus_{j=1}^n \mathcal{M}_j := \mathfrak{M}(\mathcal{E}')$$

Claim 2.3.15 — Both definitions on product of σ -algebra are equivalent.

Proof. The goal is to show that $\mathfrak{M}(\mathcal{E}) = \mathfrak{M}(\mathcal{E}')$.

(\supseteq) Obviously, $\mathcal{E}' \subseteq \mathcal{E}$ so $\mathfrak{M}(\mathcal{E}') \subseteq \mathfrak{M}(\mathcal{E})$.

(\subseteq) We want to show that $\mathcal{E} \subseteq \mathfrak{M}(\mathcal{E}')$. Fix $(E_1 \times E_2 \times \cdots \times E_n) \in \mathcal{E}$ then from the definition of σ -algebra generated by a collection, which is closed under intersection, so we can pick an element from the construction of \mathcal{E}' and do the intersection, so $(E_1 \times E_2 \times \cdots \times E_n) \in \mathfrak{M}(\mathcal{E}')$.

□

Theorem 2.3.16

Given $(X_1, \mathcal{M}_1), (X_2, \mathcal{M}_2)$ measurable spaces. Assume that \mathcal{M}_1 is generated by a collection \mathcal{E}_1 and \mathcal{M}_2 is generated by a collection \mathcal{E}_2 . Then $\mathcal{M}_1 \oplus \mathcal{M}_2$ is generated by the sets $E_1 \times X_2, X_1 \times E_2$, where $E_1 \in \mathcal{E}_1$ and $E_2 \in \mathcal{E}_2$.

Proof. Let $\mathcal{P} := \{E_1 \times E_2 : E_i \in \mathcal{E}_i\}$, obviously $\mathfrak{M}(\mathcal{P}) = \mathfrak{M}(\{E_1 \times X_2 : E_1 \in \mathcal{E}_1\} \cup \{X_1 \times E_2 : E_2 \in \mathcal{E}_2\})$ and $\mathfrak{M}(\mathcal{P}) \subseteq \mathcal{M}_1 \oplus \mathcal{M}_2$. We need to show that $\mathcal{M}_1 \oplus \mathcal{M}_2 \subseteq \mathfrak{M}(\mathcal{P})$. Define

$$\mathcal{G}_1 = \{E_1 \subseteq X_1 : E_1 \times X_2 \in \mathfrak{M}(\mathcal{P})\}$$

$$\mathcal{G}_2 = \{E_2 \subseteq X_2 : X_1 \times E_2 \in \mathfrak{M}(\mathcal{P})\}$$

then \mathcal{G}_1 is a σ -algebra consisting of subset of X_1 which contains \mathcal{E}_1 , $\mathcal{E}_1 \subseteq \mathcal{G}_1$. \mathcal{E}_1 generates \mathcal{M}_1 so $\mathfrak{M}(\mathcal{E}_1) = \mathcal{M}_1 \subseteq \mathcal{G}_1$. So, we have $E_1 \times X_2 \in \mathfrak{M}(\mathcal{P})$ for all $E_1 \in \mathcal{M}_1$ and $X_1 \times E_2 \in \mathfrak{M}(\mathcal{P})$ for all $E_2 \in \mathcal{M}_2$. The σ -algebra generated by the sets $E_1 \times X_2, X_1 \times E_2$ is contained $\mathcal{M}_1 \oplus \mathcal{M}_2 \in \mathfrak{M}(\mathcal{P})$. □

Claim 2.3.17 — $\mathcal{B}_{\mathbb{R}} \oplus \mathcal{B}_{\mathbb{R}} = \mathcal{B}_{\mathbb{R}^2}$.

where $\mathcal{B}_{\mathbb{R}} \oplus \mathcal{B}_{\mathbb{R}}$ is generated by $E_1 \times E_2$, where $E_1, E_2 \in \mathcal{B}_{\mathbb{R}}$. and $\mathcal{B}_{\mathbb{R}^2}$ is generated by the open sets in \mathbb{R}^2 .

Proof. $\mathcal{B}_{\mathbb{R}} \oplus \mathcal{B}_{\mathbb{R}} \subseteq \mathcal{B}_{\mathbb{R}^2}$. Want $\mathcal{B}_{\mathbb{R}^2} \subseteq \mathcal{B}_{\mathbb{R}} \oplus \mathcal{B}_{\mathbb{R}}$. Consider the collection of all open rectangle of the form $(a_1, b_1) \times (a_2, b_2)$ such $a_i, b_i \in \mathbb{Q}$. which are contained in $O \subseteq \mathbb{R}^2$ \square

Definition 2.3.18 (The Borel σ algebra on the extended real line). We use the notion $\overline{\mathbb{R}} = \mathbb{R} \cup \{-\infty, \infty\} = [-\infty, \infty]$. One possibility to define “ $\mathcal{B}_{\overline{\mathbb{R}}}$ ” is the σ -algebra generated by open sets in \mathbb{R} , $\{\infty\}$, $\{-\infty\}$ open intervals should be (a, b) , $(a, \infty]$, $[-\infty, b)$ for $-\infty \leq a < b \leq \infty$. Then define $d(x, y) = |\arctan(x) - \arctan(y)|$ and $\arctan(\infty) = \pi/2$, $\arctan(-\infty) = -\pi/2$.

§2.4 Measures

Definition 2.4.1. Measures are σ -additive set functions, $\mu(\emptyset) = 0$ and

$$\mu \left(\biguplus_{j=1}^{\infty} E_j \right) = \sum_{j=1}^{\infty} \mu(E_j)$$

where E_1, E_2, \dots is a sequence of disjoint sets.

Remark 2.4.2. There is some property

$$E \subseteq F \implies \mu(E) \leq \mu(F)$$

$$F = E \uplus (F \setminus E) \implies \mu(F) = \mu(E) + \mu(F \setminus E)$$

$\mu(\bigcup A_j) \leq \sum \mu(A_j)$ we can write $\bigcup A_j$ as a disjoint union, i.e., $E_1 = A_1$, $E_2 = A_2 \setminus A_1$, $E_3 = A_3 \setminus (A_1 \cup A_2)$, and so on then $\mu(\bigcup A_j) = \mu(\bigcup E_j) = \sum \mu(E_j) \leq \sum \mu(A_j)$

The monotone convergence theorem for sets (continuity from below)

Theorem 2.4.3

If $E_1 \subseteq E_2 \subseteq E_3 \subseteq \dots$ then

$$\mu \left(\bigcup_{j=1}^{\infty} E_j \right) = \lim_{j \rightarrow \infty} \mu(E_j)$$

Proof.

$$\bigcup_{j=1}^{\infty} E_j = E_1 \cup (E_2 \setminus E_1) \cup (E_3 \setminus (E_1 \cup E_2)) \cup \dots$$

So, we define $B_1 = E_1, B_n = E_n \setminus E_{n-1}$ for $n \geq 2$ then all B_j are disjoint.

$$\begin{aligned} \bigcup_{j=1}^{\infty} E_j &= \bigcup_{j=1}^{\infty} B_j \\ \mu \left(\bigcup_{j=1}^{\infty} E_j \right) &= \mu \left(\bigcup_{j=1}^{\infty} B_j \right) \\ &= \sum_{j=1}^{\infty} \mu(B_j) \\ &= \mu(E_1) + \sum_{j=2}^{\infty} \mu(E_j \setminus E_{j-1}) \\ &= \mu(E_1) + \sum_{j=2}^{\infty} \mu(E_j) - \mu(E_{j-1}) \\ &= \lim_{n \rightarrow \infty} \mu(E_n) \end{aligned}$$

□

Remark 2.4.4. If we prove something for the set then we can prove it for the complement.

$$\mu(A) + \mu(A^c) = \mu(X)$$

Theorem 2.4.5

If $\mu(X) < \infty$ then if $E_1 \supseteq E_2 \supseteq E_3 \supseteq \dots, E_n \supseteq E_{n+1}$ for all n then

$$\mu \left(\bigcap_{j=1}^{\infty} E_j \right) = \lim_{j \rightarrow \infty} \mu(E_j)$$

Proof. Assume E_j are decreasing, i.e.,

$$E_1 \supseteq E_2 \supseteq E_3 \supseteq \dots$$

then $E_1^c \subseteq E_2^c \subseteq \dots$ then

$$\begin{aligned}\mu\left(\bigcup_{j=1}^{\infty} E_j^c\right) &= \lim_{j \rightarrow \infty} \mu(E_j^c) \\ \mu(X) - \mu\left(\left(\bigcup_{j=1}^{\infty} E_j^c\right)^c\right) &= \lim_{j \rightarrow \infty} (\mu(X) - \mu(E_j)) \\ \mu(X) - \mu\left(\bigcap_{j=1}^{\infty} E_j\right) &= \lim_{j \rightarrow \infty} (\mu(X) - \mu(E_j))\end{aligned}$$

□

Example 2.4.6

\mathbb{N} with counting measure, $E_j = \{j, j+1, j+2, \dots\}$, $\mu(E_j) = \infty$, $\bigcap E_j = \emptyset$ has measure 0.

Definition 2.4.7. If A_1, A_2, A_3, \dots is an arbitrary sequence of measurable sets. We can define

$$\begin{aligned}\limsup A_j &:= \bigcap_{n=1}^{\infty} \bigcup_{j \geq n} A_j = \{x : x \in A_n \text{ for infinitely many } n\} \\ \liminf A_j &:= \bigcup_{n=1}^{\infty} \bigcap_{j \geq n} A_j = \{x : x \text{ belong to all but finitely many}\}\end{aligned}$$

Lemma 2.4.8 (Borel-Cantelli Lemma)

If $\{A_j\}$ is a sequence of measurable sets such that

$$\sum_{j=1}^{\infty} \mu(A_j) < \infty$$

then almost every x (meaning all x except in a null set) belong to on A_n for only finitely many n . Or equivalently,

$$\mu(\limsup A_n) = 0$$

Proof. $\bigcup_{j \geq n} A_j$ are decreasing. In Borel Cantelli, we have $\sum \mu(A_j) < \infty$, so $\mu(\bigcup A_n) = 0$.

use “continuity from above”

$$\mu(\limsup A_n) = \lim_{n \rightarrow \infty} \mu \left(\bigcup_{j \geq n} A_j \right)$$

$$\mu \left(\bigcup_{j \geq n} A_j \right) \leq \sum_{j \geq n} \mu(A_j) \rightarrow 0$$

as $n \rightarrow \infty$. □

Completion of a σ -algebra (when a measure μ is given), (X, \mathcal{M}, μ) $\overline{\mathcal{M}}$ consists of all unions $E \cup F$, where $E \in \mathcal{M}$ and $F \subseteq N \in \mathcal{M}$ for some null set N , $\mu(N) = 0$.

Define $\overline{\mu}$ by $\overline{\mu}(E \cup F) = \mu(E)$.

§2.5 Measurable Functions

Definition 2.5.1. $f : X \rightarrow Y$ where (X, \mathcal{M}) and (Y, \mathcal{N}) are measurable spaces. f is $(\mathcal{M}, \mathcal{N})$ -measurable if for every $E \in \mathcal{N}$, $f^{-1}(E) \in \mathcal{M}$. where $f^{-1}(E) = \{x \in X : f(x) \in E\}$.

Lemma 2.5.2

Let \mathcal{E} generate \mathcal{N} (i.e., $\mathcal{N} = \mathfrak{M}(\mathcal{E})$). Then f is $(\mathcal{M}, \mathcal{N})$ -measurable if and only if $f^{-1}(E) \in \mathcal{M}$ for all $E \in \mathcal{E}$.

Proof. Define $\mathcal{C} = \{E : f^{-1}(E) \in \mathcal{M}\}$, observe that \mathcal{C} is a σ -algebra. then

$$f(x) \in \bigcup E_j \iff x \in f^{-1}\left(\bigcup E_j\right) \iff x \in \bigcup f^{-1}(E_j) \iff \bigcup \{x : f(x) \in E_j\}$$

□

Claim 2.5.3 — $f : X \rightarrow Y$ is $(\mathcal{M}, \mathcal{N})$ -measurable, $g : Y \rightarrow Z$ is $(\mathcal{N}, \mathcal{R})$ -measurable then $g \circ f : X \rightarrow Z$ is $(\mathcal{M}, \mathcal{R})$ -measurable.

Proof. $(g \circ f)^{-1}(E) = \{x \in X : g(f(x)) \in E\} = f^{-1}(g^{-1}(E)) = \{x \in X : f(x) \in g^{-1}(E)\}$ □

vector-valued-function $f : X \rightarrow (Y_1 \times Y_2 \times \cdots \times Y_n)$ and defined by $x \mapsto (f_1(x), f_2(x), \dots, f_n(x))$ where $f_j : X \rightarrow Y_j$ is $(\mathcal{M}, \mathcal{N}_j)$ -measurable.

Then f is $(\mathcal{M}, \mathcal{N}_1, \mathcal{N}_2, \dots, \mathcal{N}_n)$ if and only if $f_i(\mathcal{M}_i, \mathcal{N}_i)$ -measurable.

$$\begin{aligned} f^{-1}(E_1 \times E_2 \times \cdots \times E_n) &= f_1^{-1}(E_1) \cap f_2^{-1}(E_2) \cap \cdots \cap f_n^{-1}(E_n) \\ &= \bigcap_{j=1}^n f_j^{-1}(E_j) \end{aligned}$$

Let $f : X \rightarrow \mathbb{R}$, $g : X \rightarrow \mathbb{R}$ \mathcal{M} σ -algebra on X , f, g are \mathcal{M} -measurable What about $f(x) + g(x)$

$M(x) = \max\{f(x), g(x)\}$, $f, g : X \rightarrow \mathbb{R}$, \mathcal{M} -measurable. The collection (a, ∞) generates the Borel σ -algebra on \mathbb{R} . $(a, \infty) \setminus (b, \infty) = (a, b]$ for $a < b$ and $(a, c) = \bigcup_n (a, c - \frac{1}{n}]$
 $M^{-1}(a, \infty) = \{x : f(x) > a, g(x) > a\} = f^{-1}(a, \infty) \cap g^{-1}(a, \infty)$

$f_n : X \rightarrow \mathbb{R}$, \mathcal{M} -measurable, then $S = \sup_n f_n$ is \mathcal{M} -measurable. $S^{-1}(a, \infty) = \{x : \sup f_n(x) > a\} = \bigcup_n \{x : f_n(x) > a\} = \bigcup f_n^{-1}(a, \infty)$

Similar for min and inf.

Definition 2.5.4. If $f_n : X \rightarrow \mathbb{R}$, \mathcal{M} -measurable then

$$\limsup f_n = \inf_k \sup_{n \geq k} f_n$$

$$\liminf f_n = \sup_k \inf_{n \geq k} f_n$$

Claim 2.5.5 — $\limsup f_n$ and $\liminf f_n$ are \mathcal{M} -measurable.

Proof. f_n has a pointwise limit if $\lim_{n \rightarrow \infty} f_n(x)$ exists for all $x \in X$. $\{x \subseteq X : \lim f_n(x) \text{ exists}\} = \{x \subseteq X : \underbrace{\limsup f_n(x) - \liminf f_n(x)}_{D(x)} = 0\} = D^{-1}(\{0\})$ \square

3 Integration

§3.1 Simple Functions

Definition 3.1.1. nonnegative simple function are measurable function with finitely many values in \mathbb{R} (NOT on $\overline{\mathbb{R}}$). $s : X \rightarrow \mathbb{R}$, $s(x) = \sum z_j \mathbb{1}_{x, s(z)=z_j}(x) = \sum z_j \mathbb{1}_{f^{-1}(z_j)}$ If values of s are $\{z_1, \dots, z_n\}$

Theorem 3.1.2

Consider nonnegative measurable function f . There exist a sequence of simple function s_n such that

- $0 \leq s_n \leq s_{n+1} \leq f$ (i.e, $s_n(x) \leq s_{n+1}(x)$)
- $\lim_{n \rightarrow \infty} s_n(x) = f(x)$ for all x
- The convergence is uniform on all sets where f is bounded. If E is such that $|f(x)| \leq M$ for all $x \in E$ then

$$\sup_{x \in E} f(x) - s_n(x) \rightarrow 0$$

Proof. s_n is defined so that it takes value in $[0, 2^n)$. Consider the segment $\frac{k}{2^n}$ on y-axis, then

$$s_n(x) = \begin{cases} k \cdot 2^{-n} & \text{if } k2^{-n} \leq f(x) < (k+1)2^{-n}, 0 \leq k \leq 2^n - 1 \\ 2^n & \text{if } f(x) \geq 2^n \end{cases}$$

If $f(x) < 2^n$ then $0 \leq f(x) - s_n(x) < 2^{-n}$. We can see that $s_n(x) \leq s_{n+1}(x)$ because each step of s_{n+1} is a refinement of s_n . \square

We first define the integral for simple function (in analogy to the definition of Riemann-integral for step functions)

Definition 3.1.3. Define $s(x) = \sum_j c_j \mathbb{1}_{E_j}$ where the E_j are pairwise disjoint, $\biguplus E_j = X$, then

$$\int s \, d\mu = \sum_j c_j \mu(E_j)$$

Claim 3.1.4 —

$$s(x) = \sum_{j=1}^n c_j \mathbb{1}_{E_j}(x) = \sum_{k=1}^m d_k \mathbb{1}_{E_k}(x)$$

where $X = \biguplus E_j = \biguplus E_k$. If $x \in E_j \cap E_k$ then $c_j = d_k$.

Proof. We know that $\biguplus_{j,k} E_j \cap E_k = X$ and $E_j = \biguplus_k E_j \cap E_k$

GOAL: $\sum_{j=1}^n c_j \mu(E_j) = \sum_{k=1}^m d_k \mu(F_k)$

$$\begin{aligned} \text{LHS} &= \sum_{j=1}^n c_j \sum_{k=1}^{\infty} \mu(E_j \cap F_k) = \sum_{k=1}^m \sum_{j=1}^n d_k \mu(E_j \cap E_k) \\ &= \sum_{k=1}^m d_k \mu(F_k) \end{aligned}$$

□

Lemma 3.1.5

Suppose s, t are simple functions then

$$\int (s + t) \, d\mu = \int s \, d\mu + \int t \, d\mu$$

Remark 3.1.6. Can shortly write

$$\int s + t = \int s + \int t$$

Proof.

$$\begin{aligned} s &= \sum_{j=1}^n c_j \mathbb{1}_{E_j} = \sum_j \sum_k c_j \mathbb{1}_{E_j \cap F_k} \\ t &= \sum_{k=1}^m d_k \mathbb{1}_{F_k} = \sum_j \sum_k d_k \mathbb{1}_{E_j \cap F_k} \\ s + t &= \sum_{j,k} (c_j + d_k) \mathbb{1}_{E_j \cap F_k} \end{aligned}$$

$$\begin{aligned}
\int s \, d\mu &= \sum_{j,k} c_j \mu(E_j \cap F_k) \\
\int t \, d\mu &= \sum_{j,k} d_k \mu(E_j \cap F_k) \\
\int (s + t) \, d\mu &= \sum_{j,k} (c_j + d_k) \mu(E_j \cap F_k)
\end{aligned}$$

□

Lemma 3.1.7

$\nu(E) = \int_E s \, d\mu = \int s \mathbb{1}_E \, d\mu = \sum c_j \mu(E_j \cap E)$ this defines a measure on \mathcal{M} (given σ -algebra)

Proof. If E^l is a sequence of pairwise disjoint measurable set, check

$$\begin{aligned}
\nu\left(\biguplus E^l\right) &= \sum \nu(E^l) \\
\nu\left(\biguplus E^l\right) &= \sum c_j \mu(E_j \cap \biguplus E^l) \\
&= \sum_{j=1}^n c_j \sum_l \mu(E_j \cap E^l) \\
&= \sum_l \sum_j c_j \mu(E_j \cap E^l) \\
&= \sum_l \nu(E^l)
\end{aligned}$$

□

§3.2 Non-negative Measurable Functions

Definition 3.2.1. For any non-negative f , a measurable function, define

$$\int f \, d\mu = \sup_{\substack{s \leq f \\ s \text{ simple}}} \int s \, d\mu$$

Remark 3.2.2. If $0 \leq f \leq g$ then $\int f \, d\mu \leq \int g \, d\mu$

Theorem 3.2.3 (Monotone Convergence Theorem)

If $\{f_n\}$ is a sequence of measurable function, and $0 \leq f_n \leq f_{n+1}$ for all n . (that means $f(x) = \lim_{n \rightarrow \infty} f_n(x)$) Then

$$\int f \, d\mu = \lim_{n \rightarrow \infty} \int f_n \, d\mu$$

Proof. Since $f_n \leq f_{n+1} \leq f$ then

$$\lim_{n \rightarrow \infty} \int f_n \, d\mu \leq \int f \, d\mu$$

We need to show that

$$\int f \, d\mu \leq \lim_{n \rightarrow \infty} \int f_n \, d\mu$$

So, it suffices to show that for any $0 \leq s \leq f$, that

$$\int s \, d\mu \leq \lim_{n \rightarrow \infty} \int f_n \, d\mu$$

It suffices to show that for any $\varepsilon > 0$,

$$(1 - \varepsilon) \int s \, d\mu \leq \lim_{n \rightarrow \infty} \int f_n \, d\mu$$

Define $E_n = \{x : (1 - \varepsilon)s(x) \leq f_n(x)\}$, any x will be in one of the E_n . Then for any $x \in E_n$,

$$s(x) \leq \frac{f_n(x)}{1 - \varepsilon}$$

Consider the measure defined by

$$\nu(E) = \int_E s \, d\mu$$

(we already show this is a measure in 3.1.7). We have $E_n \subseteq E_{n+1}$ and $E_n \rightarrow X$. By continuity from below 2.4.3,

$$\lim_{n \rightarrow \infty} \nu(E_n) = \nu(X) = \int s \, d\mu$$

We get that

$$\nu(E_n) = \int_{E_n} s \, d\mu \leq \int_{E_n} \frac{f_n(x)}{1 - \varepsilon} \, d\mu \leq \int \frac{f_n(x)}{1 - \varepsilon} \, d\mu = \frac{1}{1 - \varepsilon} \int f_n(x) \, d\mu$$

Finally, we take limit on both sides and we have

$$\lim_{n \rightarrow \infty} \nu(E_n) = \nu(\mathbb{R}) = \int s \, d\mu \leq \lim_{n \rightarrow \infty} \frac{1}{1 - \varepsilon} \int f_n \, d\mu$$

□

Lemma 3.2.4

If f, g are non negative measurable function then

$$\int (f + g) \, d\mu = \int f \, d\mu + \int g \, d\mu$$

Proof. Now we have a tool

- Monotone Convergence Theorem
- Existence of $s_n \gg f, t_n \gg g$

$$\begin{aligned} \int (s_n + t_n) \, d\mu &= \int s_n \, d\mu + \int t_n \, d\mu \\ \int (f + g) \, d\mu &= \int f \, d\mu + \int g \, d\mu \end{aligned}$$

□

Lemma 3.2.5

$f_k \geq 0$, f_k is measurable

$$\int \sum_{k=1}^{\infty} f_k(x) \, d\mu = \sum_{k=1}^{\infty} \int f_k \, d\mu$$

Proof. Just apply the Monotone Convergence Theorem.

$$s_n(x) = \sum_{k=1}^n f_k(x) \rightarrow \sum_{k=1}^{\infty} f_k(x)$$

□

Remark 3.2.6. We cannot always interchange integrals and limits (monotonicity is key)
 $f_n(x) = \frac{1}{n} \mathbb{1}_{[0,n]}$, $\int f_n \, d\mu = 1$ but $\lim_{n \rightarrow \infty} f_n(x) = 0$.

$$0 = \int \lim_{n \rightarrow \infty} f_n(x) \, d\mu < \lim_{n \rightarrow \infty} \int f_n \, d\mu$$

Or on $[0, 1]$, $f_n(x) = n \mathbb{1}_{[0, 1/n]}$, $\int f_n \, d\mu = 1$ but $\lim_{n \rightarrow \infty} f_n(x) = 0$.

$$\lim_{n \rightarrow \infty} f_n(x) = \begin{cases} \infty & \text{if } x = 0 \\ 0 & \text{if } x > 0 \end{cases}$$

Lemma 3.2.7 (Fatou's Lemma)

If $\{f_j\}$ is a sequence of measurable functions

$$\int \liminf_{j \rightarrow \infty} f_j(x) \, d\mu \leq \liminf_{j \rightarrow \infty} \int f_j \, d\mu$$

meaning

$$\int \lim_{k \rightarrow \infty} \underbrace{\inf_{j \geq k} f_j(x)}_{\text{increasing on } k} \, d\mu \leq \lim_{k \rightarrow \infty} \inf_{j \geq k} \int f_j \, d\mu$$

Proof.

$$\int \lim_{k \rightarrow \infty} \inf_{j \geq k} f_j(x) \, d\mu \stackrel{\text{MCT}}{=} \lim_{k \rightarrow \infty} \int \inf_{j \geq k} f_j(x) \, d\mu$$

Take any $l \geq k$, then $\inf_{j \geq k} f_j(x) \leq f_l(x)$, then for $l \geq k$

$$\begin{aligned} \int \inf_{j \geq k} f_j(x) \, d\mu &\leq \int f_l(x) \, d\mu \\ \int \inf_{j \geq k} f_j(x) \, d\mu &\leq \inf_{j \geq k} \int f_j(x) \, d\mu \end{aligned}$$

□

§3.3 General Measurable Functions

Integral for “general” measurable functions.

Definition 3.3.1. Given a measurable function f , we define the **positive part** of f as

$$f^+(x) = \max\{f(x), 0\}$$

and the **negative part** of f as

$$f^-(x) = \max\{-f(x), 0\}$$

Then we get that

$$f = f^+ - f^-$$

Definition 3.3.2. $f : X \rightarrow \mathbb{R}$ (or $\overline{\mathbb{R}}$) Suppose that f is a measurable function, then we define

$$\int f \, d\mu = \int f^+ \, d\mu - \int f^- \, d\mu$$

provided that at least one of $\int f^\pm \, d\mu$ is finite

Definition 3.3.3. $f : X \rightarrow \mathbb{R}$ (or $\overline{\mathbb{R}}$) f is **integrable** if $\int f^+ \, d\mu, \int f^- \, d\mu$ is finite $\iff \int |f| \, d\mu$ is finite

\mathcal{L}^1 is the class of integrable function

Definition 3.3.4. $f : X \rightarrow \mathbb{C}$ is measurable ($\iff \Re(f)$ and $\Im(f)$ are measurable) Assumeing that $\Re f \in \mathcal{L}^1$ and $\Im f \in \mathcal{L}^1$ then

$$\int f \, d\mu = \int \Re f \, d\mu + i \int \Im f \, d\mu$$

Claim 3.3.5 — Suppose that f, g are measurable then

$$\int f + g \, d\mu = \int f \, d\mu + \int g \, d\mu$$

$$\int \alpha f \, d\mu + \alpha \int f \, d\mu$$

Lemma 3.3.6

$f : X \rightarrow \overline{\mathbb{R}}$ is measurable, and $\int |f| \, d\mu = 0$ then $f = 0$ almost everywhere.

Proof. Assume that $\int |f| \, d\mu = 0$ Find simple function s_n of f then $\int s_n \, d\mu = 0 \implies s_n(x) = 0$ almost everywhere. we claim that $s_n \rightarrow f$ everywhere then $s_n = 0$ almost everywhere then $f = 0$ almost everywhere. There is a set $N_n, \mu(N_n) = 0$ so that $s_n = 0$ in N_n^c . $N = \bigcup_{n=1}^\infty N_n \implies \mu(N) = 0$ and N^c we have $s_n \rightarrow f, s_n = 0$ \square

We could redefine the notion of $f = 0$ (being $f(x) = 0$ for all $x \in X$) to $f = 0$ almost everywhere (meaning $f(x) = 0$ except for all null set).

Remark 3.3.7. $\|f\| = \int |f| \, d\mu$ satisfies

- $\|f + g\| \leq \|f\| + \|g\|$
- $\|cf\| = |c|\|f\|$

- $\|f\| = 0 \iff f = 0$ almost everywhere

Remark 3.3.8. Almost everywhere equal is an equivalence relation.

$$f \sim g \stackrel{\text{def}}{\iff} f(x) = g(x) \text{ } \mu\text{-almost everywhere}$$

$N = \{f \in \mathcal{L}^1 : f(x) = 0 \text{ almost everywhere}\}$ is a linear subspace of \mathcal{L}^1 vector. \mathcal{L}^1/N is the set of equivalence classes of \mathcal{L}^1 .

$f_n \rightarrow f$ almost everywhere, $f_n \geq 0$, f_n measurable, Can we define $\int f \, d\mu$? f may not be measurable. This problem is fixed if f we work in a complete measurable space $(X, \mathcal{M}, \mu) \rightarrow (X, \overline{\mathcal{M}}, \overline{\mu})$ where

$$\overline{\mathcal{M}} = \{A \cup B : A \in \mathcal{M}, B \text{ a subset of a set of measure } 0\}$$

Lemma 3.3.9

$f \in \mathcal{L}^1$, $\int |f| \, d\mu < \infty$. If f is real valued $f = f^+ - f^-$,

$$\left| \int f \, d\mu \right| \leq \int |f| \, d\mu$$

Proof.

$$\begin{aligned} \left| \int f \, d\mu \right| &= \left| \int f^+ - f^- \, d\mu \right| \\ &\leq \left| \int f^+ \, d\mu \right| + \left| \int f^- \, d\mu \right| \\ &= \int f^+ \, d\mu + \int f^- \, d\mu \\ &= \int |f| \, d\mu \end{aligned}$$

□

Remark 3.3.10. If f is complex valued, then $|f| = \sqrt{(\Re f)^2 + (\Im f)^2}$. Then

$$\begin{aligned} \left| \int \Re f \right| &\leq \int |\Re f| \leq \int |f| \\ \left| \int \Im f \right| &\leq \int |\Im f| \leq \int |f| \end{aligned}$$

So,

$$\left| \int f \, d\mu \right| \leq 2 \int |f|$$

Remark 3.3.11. Estimate $\int f \, d\mu = \alpha + i\beta = re^{i\phi}$, then $e^{-i\phi} \int f \, d\mu$ is real and nonnegative.

$$\begin{aligned} \left| \int f \, d\mu \right| &= \left| e^{-i\phi} \int f \, d\mu \right| \\ &= \Re \int e^{-i\phi} f \, d\mu \\ &\leq \int |e^{-i\phi} f| \, d\mu \\ &= \int |f| \, d\mu \end{aligned}$$

Lemma 3.3.12

$f \in \mathcal{L}^+$ means non-negative, then $\nu(E) = \int_E f \, d\mu$ define measure

Proof. Check the σ -additivity $E = \biguplus_{n=1}^{\infty} E_n$,

$$\begin{aligned} \nu \left(\biguplus_{n=1}^{\infty} E_n \right) &= \int_{\biguplus E_n} f \, d\mu \\ &= \int f \mathbb{1}_{\biguplus E_n} \, d\mu \\ &= \int f \left(\sum_{n=1}^{\infty} \mathbb{1}_{E_n} \right) \, d\mu \\ &= \sum_{n=1}^{\infty} \int f \mathbb{1}_{E_n} \, d\mu \\ &= \sum_{n=1}^{\infty} \nu(E_n) \end{aligned}$$

□

Claim 3.3.13 — If $f \in \mathcal{L}^1 \cap \mathcal{L}^+$ then ν is a finite measure.

If $\nu(E) = \int_E f \, d\mu$ How does $\int g \, d\nu$ look like? $\nu(E) = \int f \, d\mu = \int E \, d\nu$ We want “ $f \, d\mu = d\nu$ ”

Lemma 3.3.14

If $f \in \mathcal{L}^+$ and $\nu(E) = \int_E f \, d\mu$ then for any $g \in \mathcal{L}^+$ or $g \in \mathcal{L}^1$ then,

$$\int g \, d\nu = \int gf \, d\mu$$

Proof. • True for characteristic functions of measure set by the definition of ν . Fix $g = \mathbb{1}_E$ for some $E \in \mathcal{M}$

$$\int g \, d\nu = \int \mathbb{1}_E \, d\mu = \nu(E) = \int_E f \, d\mu = \int \mathbb{1}_E f \, d\mu = \int gf \, d\mu$$

• By linearity of the integral, it is true for simple function. Fix $g = \sum_{j=1}^n c_j \mathbb{1}_{E_j}$, then

$$\int g \, d\nu = \sum_{j=1}^n c_j \nu(E_j) = \sum_{j=1}^n c_j \int_{E_j} f \, d\mu = \int gf \, d\mu$$

• $s_n \nearrow g$ if $g \in \mathcal{L}^+$, by Monotone convergence theorem,

$$\int s_n \nearrow_{\text{MCT}} \int g$$

$$\begin{aligned} \int s_n \, d\nu &= \int s_n f \, d\mu \\ \int g \, d\nu &= \int gf \, d\mu \end{aligned}$$

Then extend to general g by linearity

□

Theorem 3.3.15

If X is a finite measure space, if f_n measurable, $f_n \in \mathcal{L}^1$ (integrable) and $f_n \rightarrow f$ uniformly on X . then

$$\int |f_n - f| \, d\mu \rightarrow 0$$

and

$$\int f_n \, d\mu \rightarrow \int f \, d\mu$$

Remark 3.3.16. Uniform convergence means

$$\lim_{n \rightarrow \infty} \sup_{x \in X} |f_n(x) - f(x)| = 0$$

Proof. We can rewrite that term as

$$\begin{aligned} \int |f_n - f| \, d\mu &\leq \int \sup_{x \in X} |f_n - f| \, d\mu \\ &= \mu(X) \sup_{x \in X} |f_n - f| \rightarrow 0 \end{aligned}$$

We can rewrite f as $f = (f - f_n) + (f_n)$ since $f - f_n$ converge and f_n integrable so f must be integrable.

$$\begin{aligned} \left| \int f_n - \int f \right| &= \left| \int (f_n - f) \, d\mu \right| \\ &\leq \int |f_n - f| \, d\mu \end{aligned}$$

□

Definition 3.3.17. Suppose that f_n, f are measurable $f_n \rightarrow f$ almost uniformly if for every $\varepsilon > 0$ there is a measurable set E such that $\mu(E) < \varepsilon$ and $f_n \rightarrow f$ uniformly on E^c ($\sup_{x \in E^c} |f_n(x) - f(x)| \rightarrow 0$)

Theorem 3.3.18 (Egorov's Theorem)

If $\mu(X) < \infty$ and if $f_n \rightarrow f$ almost everywhere then $f_n \rightarrow f$ almost uniformly

Remark 3.3.19. $f_n(x) \rightarrow f(x)$ if for every k there exists $n = n(k)$ such that $|f_m(x) - f(x)| < \frac{1}{k}$ for all $m \geq n(k)$

Proof. Fix $\varepsilon > 0$, define

$$\begin{aligned} E_n(k) &:= \left\{ x : |f_m(x) - f(x)| \geq \frac{1}{k} \text{ for some } m \geq n \right\} \\ &= \bigcup_{m \geq n} \left\{ x : |f_m(x) - f(x)| \geq \frac{1}{k} \right\} \end{aligned}$$

(Given x For sufficiently large n , $x \notin E_n(k)$), $E_n(k) \supseteq E_{n+1}(k) \cap_n E_n(k) = \emptyset$ because of $f_n \rightarrow f$ everywhere. Form the continuity from above 2.4.5, we get that

$\lim_{n \rightarrow \infty} \mu(E_n(k)) = 0$. Find $n(k)$ such that $\mu(E_{n(k)}(k)) < \frac{\varepsilon}{2^k}$, then $E = \bigcup_k E_{n(k)}(k)$ has measure $< \varepsilon$.

For $x \in \left(\bigcup_k E_{n(k)}(k)\right)^c = \bigcap_k E_{n(k)}(k)^c$ I have for all k $|f_m(x) - f(x)| < \frac{1}{k}$ for all $m \geq n(k)$. So, we get $f_n \rightarrow f$ uniformly on E^c . \square

Theorem 3.3.20 (Baby Dominated Convergence Theorem)

Given (X, \mathcal{M}, μ) where μ is a finite measure ($\mu(X) < \infty$). Let $\{f_n\}$ be measurable functions, $f_n \rightarrow f$ everywhere.

$$|f_n| \leq C \implies \int |f_n - f| \, d\mu \rightarrow 0$$

i.e. f_n converges with respect to L^1 -(semi-)norm.

Corollary 3.3.21

$$\int_X f_n \, d\mu \rightarrow \int_X f \, d\mu$$

Proof. Tools:

- (i) If $f_n \rightarrow f$ uniformly then $\int |f_n - f| \, d\mu \rightarrow 0$
- (ii) Egorov's Theorem

$|f(x)| \leq C$, f is measurable. Given any $\varepsilon > 0$, By Egorov's Theorem, find a set of measure E that $\mu(E) < \frac{\varepsilon}{4C}$ such that $f_n \rightarrow f$ uniformly on E^c . Then

$$\int |f_n - f| \, d\mu \leq \int_E |f_n - f| \, d\mu + \int_{E^c} |f_n - f| \, d\mu$$

we know that $|f_n - f| \leq |f_n| + |f| \leq 2C$ then

$$\begin{aligned} \int |f_n - f| \, d\mu &\leq 2C\mu(E) + \int_{E^c} |f_n - f| \, d\mu \\ &\leq \frac{\varepsilon}{2} + \int_{E^c} |f_n - f| \, d\mu \end{aligned}$$

so for large n , the second term will be $< \frac{\varepsilon}{2}$. \square

Theorem 3.3.22 (Dominated Convergence Theorem)

Given (X, \mathcal{M}, μ) where μ is a finite measure ($\mu(X) < \infty$). Let $\{f_n\}$ be measurable functions, $f_n \rightarrow f$ almost everywhere.

$$\sup_n |f_n| \in \mathcal{L}^1 \implies \int |f_n - f| \, d\mu \rightarrow 0$$

Proof. Define $g(x) = \sup_n |f_n(x)|$ The trick is

$$|f_n - f| = \begin{cases} \frac{|f_n - f|}{g} g & \text{if } g > 0 \\ 0 & \text{if } g = 0 \end{cases}$$

define a new measure $\nu(E) = \int_E g \, d\mu$. Then ν is a finite measure, and

$$\begin{aligned} g \, d\mu &= d\nu \\ \int h \, d\nu &= \int h g \, d\mu \end{aligned}$$

then define

$$h_n = \begin{cases} \frac{|f_n - f|}{g} & \text{if } g > 0 \\ 0 & \text{if } g = 0 \end{cases} \implies \begin{aligned} |h_n(x)| &\leq 1 \\ h_n(x) &\rightarrow 0 \end{aligned}$$

Then

$$\begin{aligned} \int |f_n - f| \, d\mu &= \int h_n g \, d\mu \\ &= \int h_n \, d\nu \rightarrow 0 \end{aligned}$$

By Baby Dominated Convergence Theorem □

§3.4 Integration from Riemann to Lebesgue**Theorem 3.4.1**

If f is Riemann integrable on $[a, b]$ then f is Lebesgue integrable.

$$\int_a^b f(x) \, dx = \int_{[a,b]} f \, d\mu$$

where μ is Lebesgue measure.

Proof. Define

$$U_P f(x) = \begin{cases} M_j & \text{if } x \in [x_{j-1}, x_j) \\ M_n & \text{if } x \in [x_{n-1}, x_n] \end{cases}$$

Similarly for the lower sum $L_P f(x)$. If P' is a refinement of P then $U_{P'} f(x) \leq U_P f(x)$ and $L_{P'} f(x) \geq L_P f(x)$. Since f is Riemann integrable, then

$$\inf_P U(f, P) =: \bar{\mathcal{I}}_a^b(f) = \underline{\mathcal{I}}_a^b(f) := \sup_P L(f, P)$$

Choose a sequence of partitions P_n such that

$$\begin{aligned} \int U_{P_n} f &\rightarrow \bar{\mathcal{I}}_a^b(f) \\ \int L_{P_n} f &\rightarrow \underline{\mathcal{I}}_a^b(f) \end{aligned}$$

Since that P_{n+1} is a refinement of the P_n then $U_{P_n} f \searrow U(x)$ and $L_{P_n} f \nearrow L(x)$ and $L(x) = U(x)$. Notice that from Riemann integrable, $|f| < C$, then

$$\begin{aligned} \int_{[a,b]} U_{P_n} f &\rightarrow \bar{\mathcal{I}}_a^b(f) = \int_{[a,b]} U(x) \, dm \\ \int_{[a,b]} L_{P_n} f &\rightarrow \underline{\mathcal{I}}_a^b(f) = \int_{[a,b]} L(x) \, dm \end{aligned}$$

If f is Riemann integrable,

$$\int U \, dm = \int L \, dm = \int_a^b f(x) \, dx$$

and $U \geq L$ then

$$\int (U - L) \, dm = 0 \implies U(x) = L(x)$$

almost everywhere, $L(x) \leq f(x) \leq U(x) \implies f = L$ almost everywhere and $f = U$ almost everywhere. Then f is Lebesgue integrable and

$$\int f \, dm = \int L \, dm = \int U \, dm$$

□

Definition 3.4.2 (Improper Riemann integrals).

$$\int_0^\infty f(x) \, dx, \int_1^\infty f(x) \, dx, \int_0^1 f(x) \, dx$$

if f is not Riemann-integrable on the domain but on every compact subinterval. We can define as

$$\int_1^\infty f(x) \, dx = \lim_{R \rightarrow \infty} \int_1^R f(x) \, dx$$

Example 3.4.3

$$\int_1^\infty \frac{\sin x}{x} dx = \lim_{R \rightarrow \infty} \int_1^R \frac{\sin x}{x} dx$$

$I_k = [2k\pi + \frac{\pi}{4}, 2k\pi + \frac{3\pi}{4}]$, $\sin x \geq \frac{1}{\sqrt{2}}$, so, $\frac{\sin x}{x} \geq \frac{1}{x\sqrt{2}} \cdot \frac{1}{2k\pi + \frac{3\pi}{4}}$. We can do integration by parts

$$\int_1^R \frac{\sin x}{x} dx = -\frac{\cos x}{x} \Big|_1^R - \int_1^R -\frac{\cos x}{x^2} dx$$

Example 3.4.4

$$\int_0^\infty \sin(x^2) dx$$

consider $\sin(x^2)$

$$\begin{aligned} \sqrt{2k\pi + \frac{\pi}{2}} &\leq \sqrt{x^2} \leq \sqrt{2k\pi + \frac{3\pi}{4}} \\ \sqrt{2k\pi + \frac{3\pi}{4}} - \sqrt{2k\pi + \frac{\pi}{4}} &\approx \frac{1}{\sqrt{k}} \end{aligned}$$

Lemma 3.4.5

Suppose that if $\int_1^\infty |f(x)| dx < \infty$ then $f \in \mathcal{L}^1$.

Proof.

$$\begin{aligned} \int_1^\infty |f(x)| dx &= \int_1^\infty \lim_{n \rightarrow \infty} |f(x)| \mathbb{1}_{[1,n]}(x) dx \\ &= \lim_{n \rightarrow \infty} \int_1^n |f(x)| dx \end{aligned}$$

□

Theorem 3.4.6

If f is integrable on \mathbb{R} ,

$$\int_{\mathbb{R}} |f(x)| \, dx < \infty$$

$f \in \mathcal{L}^1$ then for every $\varepsilon > 0$, there is a continuous function (C^∞) g , vanishes off a compact set,

$$\int |f - g| \, dm < \varepsilon$$

§3.5 Outer Measures

Definition 3.5.1. In our axiomatic theorem on the Lebesgue measure, $m(I) = \ell(I)$, $m((a, b]) = b - a$ and for a general Borel set on \mathbb{R} , m is given by the **outer measure** induced by the collection of intervals

$$\varrho(E) = \inf \sum_{k=1}^{\infty} \ell(I_k)$$

where the inf is taken over collections $\{I_k\}$, such that $E \subseteq \bigcup_{k=1}^{\infty} I_k$

Remark 3.5.2. $\tilde{\varrho}$ defined similarly but we only admit open intervals in the infimum. Obviously, $\tilde{\varrho}(E) \geq \varrho(E)$. Need to show that $\tilde{\varrho}(E) \leq \varrho(E)$ we may assume that $\varrho(E) < \infty$, show $\tilde{\varrho}(E) \leq \varrho(E) + \varepsilon$. There is a collection of intervals I_k such that

$$\sum_k \ell(I_k) < \varrho(E) + \frac{\varepsilon}{2}$$

If $I_k = [a_k, b_k]$, then define $J_k = (a_k - \frac{\varepsilon}{2^{k+2}}, b_k + \frac{\varepsilon}{2^{k+2}})$. Then $\ell(J_k) = \ell(I_k) + \frac{\varepsilon}{2^{k+1}}$ then

$$\begin{aligned} \tilde{\varrho}(E) &\leq \sum_{k=1}^{\infty} \ell(J_k) \leq \sum_{k=1}^{\infty} \ell(I_k) + \varepsilon \sum_{k=1}^{\infty} 2^{-k-1} \\ &\leq \varrho(E) + \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \end{aligned}$$

Lemma 3.5.3

$$m(E) = \sup\{m(K) : K \subseteq E, K \text{ compact}\}$$

Proof. Case where $E = \overline{E}$ and E is bounded, there is nothing to show

Assume that E is bounded, GOAL: find $K \subseteq E$ such that $m(E \setminus K) < \varepsilon$. Consider $\overline{E} \setminus E$, find $O \supseteq \overline{E} \setminus E$, $m(O \setminus (\overline{E} \setminus E)) < \varepsilon$. then $O^c \cap \overline{E} \subseteq E$ because if $x \in O^c$, either $x \in \overline{E}$ or

$x \in E$. $E \setminus K = E \cap K^c \subseteq O \cup \overline{E}^c$. Since $E \subseteq \overline{E}$ then $E \setminus K \subseteq O$ and $E \setminus K \subseteq O \setminus (\overline{E} \setminus E)$ has measure $< \varepsilon$. \square

Theorem 3.5.4

For every Borel set E , $m(E) < \infty$, there is an open set $O \supseteq E$ such that $m(O \setminus E) < \varepsilon$. where $m(E) = \inf \sum \ell(I_n)$ where inf take over I_k , I_k are open, $E \subseteq \bigcup I_k$

Proof. Define $E_n = E \cap \overline{B}(0, n)$. Find compact set $K_n \subseteq E_n \setminus E_{n-1}$ then $m((E_n \setminus E_{n-1}) \setminus K_n) < \varepsilon 2^{-n-1}$. The set $H_l = K_1 \cup \dots \cup K_l$ is compact and increasing, $H_l \subseteq E_l$ and

$$m(E_l) - \varepsilon \leq m(H_l) \leq m(E_l) \rightarrow m(E)$$

\square

Theorem 3.5.5

Given an open set O , we can decompose O as a disjoint union of “dyadic cubes”

Theorem 3.5.6

We can choose the cubes a dyadic cubes such that if $O \neq \mathbb{R}^n$ such that

$$\text{diam}(Q) < \text{dist}(Q, O^c) \leq 4\text{diam}(Q)$$

Remark 3.5.7. If side length of Q is 2^{-k} then the diameter is $\sqrt{n}2^{-k}$.

Theorem 3.5.8 (Whitney decomposition theorem)

Given Ω open set in \mathbb{R}^n , $\Omega \neq \mathbb{R}^n$, there is a family \mathcal{F} of dyadic cubes such that

- they are disjoint
- $\bigsqcup_{Q \in \mathcal{F}} Q = \Omega$
- For every $Q \in \mathcal{F}$, $C\text{diam}(Q) < \text{dist}(Q, \Omega^c) \leq (2C + 2)\text{diam}(Q)$

Proof. Define for each k a family of dyadic cubes \mathcal{F}_k of side length 2^{-k} (i.e., the diameter is $\sqrt{n}2^{-k}$) intersecting the region

$$\Omega_k = \{x : A2^{-k}\sqrt{n} \leq \text{dist}(x, \Omega^c) \leq 2A \cdot 2^{-k}\sqrt{n}\}$$

Pick a cube in \mathcal{F}_k , Q_1 it contains an $x_Q \in \Omega_k$

$$\text{dist}(Q, \Omega^{\mathbb{L}}) \leq \text{dist}(x_Q, \Omega^{\mathbb{L}}) \leq 2A \cdot 2^{-k} \sqrt{n} - 2A \text{diam}(Q)$$

$$\begin{aligned} \text{dist}(Q, \Omega^{\mathbb{L}}) &\geq \text{dist}(x_Q, \Omega^{\mathbb{L}}) - \text{diam}(Q) \\ &\geq A2^{-k} \sqrt{n} - 2A \text{diam}(Q) \\ &= (A - 1) \cdot \text{diam}(Q) \end{aligned}$$

Then $\mathcal{F}_T = \bigcup \mathcal{F}_k$ and finally \mathcal{F} = collection of all maximal (with respect to inclusion) cubes in \mathcal{F}_T . Fix Q, Q' and assume that $Q \subseteq Q'$ then

$$(A - 1) \text{diam} Q' \leq \text{dist}(Q', \Omega^{\mathbb{L}}) \leq \text{dist}(Q, \Omega^{\mathbb{L}}) \leq 2A \cdot \text{diam}(Q)$$

$$\text{then } \text{diam}(Q') \leq \frac{2A}{A-1} \text{diam}(Q)$$

□

we know that for every $\varepsilon_1 > 0$ we can find a simple function s such that $\int |f - s| \, dm < \varepsilon_1$. (For non-negative f use MCT $s_n \nearrow f$ and $s_n \leq f$ so $\int s_n \nearrow \int f \implies \int f - s_n \rightarrow 0$ and then we use $f = f_+ - f_-$)

$$s = \sum c_j \mathbb{1}_{E_j}, \quad E_j \subseteq O_j, \quad m(O_j \setminus E_j) < \varepsilon \quad \tilde{s} = \sum c_j \mathbb{1}_{O_j}$$

$$\begin{aligned} \int \tilde{s} - s \, dm &= \left| \int \sum c_j \mathbb{1}_{O_j} - \mathbb{1}_{E_j} \, dm \right| \\ &\leq \sum_{j=1}^N |c_j| |m(O_j \setminus E_j)| \\ &\leq \varepsilon_2 \end{aligned}$$

Then $\mathbb{1}_{O_j} = \sum_{\nu} \mathbb{1}_{Q_{\nu}}$ where $\{Q_{\nu}\}$ are the Whitney cubes in Whitney Theorem. $|O_j| = \sum_{\nu \in I} m(Q_{\nu})$ There is a finite \tilde{I}_j such that

$$\int \left| \mathbb{1}_{O_j} - \sum_{\nu \in \tilde{I}_j} \mathbb{1}_{Q_{\nu}} \right| < \varepsilon_3$$

replace $\sum_{j=1}^N c_j \mathbb{1}_{O_j}$ by $\sum_{j=1}^N c_j \mathbb{1}_{\bigcup_{\nu \in \tilde{I}_j} Q_{\nu}}$

then

$$\mathbb{1}_{Q_{\nu}}(x_1, \dots, x_n) = \prod_{i=1}^n \mathbb{1}_{\nu, i}(x_i)$$

Lemma 3.5.9

For any $f \in L^1$ there exists s a step function such that $\int |f - s| \, dm < \varepsilon$

Proof. Suppose that $f \in L^1$ I want to show that there exists s a step function such that $\int |f - s| \, dm < \varepsilon$ for any $\varepsilon > 0$. Since $f = f^+ - f^-$, WLOG, $f \geq 0$ (otherwise we can do each positive and negative part and do the sum of both step functions with $\frac{\varepsilon}{2}$ bound). Given any $\varepsilon > 0$, there exists s' a simple function such that $\int |f - s'| \, dm < \frac{\varepsilon}{2}$. Then we can write $s' = \sum_{j=1}^N c_j \mathbb{1}_{E_j}$, then there exists O_j open set such that $E_j \subseteq O_j$ and $m(O_j \setminus E_j) < \frac{\varepsilon}{4|c_j|N}$. Since O_j is an open set, then $O_j = \bigcup (a_i, b_i)$ then define $K_n = \bigcup_{i=1}^n (a_i, b_i)$ from continuity from below, there exists n' such that $m(K_{n'}) > m(O_j) - \frac{\varepsilon}{4|c_j|N}$ and $K_{n'}$ contain finite interval, then we define $O'_j := K_{n'}$. Define $s = \sum_{j=1}^N c_j \mathbb{1}_{O'_j}$ then

$$\begin{aligned}
 \int |f - s| \, dm &\leq \int |f - s'| \, dm + \int |s' - s| \, dm \\
 &\leq \frac{\varepsilon}{2} + \int \left| \sum_{j=1}^N c_j (\mathbb{1}_{E_j} - \mathbb{1}_{O'_j}) \right| \, dm \\
 &\leq \frac{\varepsilon}{2} + \sum_{j=1}^N |c_j| \int |\mathbb{1}_{E_j} - \mathbb{1}_{O'_j}| \, dm \\
 &= \frac{\varepsilon}{2} + \sum_{j=1}^N |c_j| (m(E_j \setminus O'_j) + m(O'_j \setminus E_j)) \\
 &\leq \frac{\varepsilon}{2} + \sum_{j=1}^N |c_j| (m(O_j \setminus O'_j) + m(O_j \setminus E_j)) \\
 &\leq \frac{\varepsilon}{2} + \sum_{j=1}^N |c_j| \left(\frac{\varepsilon}{4|c_j|N} + \frac{\varepsilon}{4|c_j|N} \right) \\
 &< \varepsilon
 \end{aligned}$$

□

4 L^p Spaces

§4.1 normed spaces

Remark 4.1.1. If $f_n \rightarrow f$ almost everywhere, do we have $\int |f_n - f| d\mu \rightarrow 0$?

- No, if $f_n = \mathbb{1}_{[n, n+1]}$ then $f_n \rightarrow 0$ almost everywhere but $\int |f_n - 0| d\mu = 1$ and $\int |f_n - f_m| d\mu = 2$.
- No, if $f_n = \mathbb{1}_{[0, \frac{1}{n}]}$

Remark 4.1.2. Convergence in L^1 implies convergence almost everywhere? No, If $2^k \leq n \leq 2^{k+1}$ where $n = 2^k + j$, $j = 0, \dots, 2^k - 1$ $f_{2^k+1} = \mathbb{1}_{[i2^{-k}, (i+1)2^{-k}]}$ for $i = 0, \dots, 2^k - 1$. For $2^k \leq n \leq 2^{k+1}$, $\|f_n\|_{L^1} = 2^{-k}$

Claim 4.1.3 — If $f_n \rightarrow f$ in L^1 ($\int |f_n - f| d\mu \rightarrow 0$) then there is a subsequence $f_{n_k} \rightarrow f$ almost everywhere.

Proof. Consider the normed space L^1 space of semi-normed space \mathcal{L}^1 . (define as a equivalence class of almost everywhere where $f \underset{\text{a.e.}}{\sim} g$ if $f = g$ almost everywhere) Construct a convergence subsequence (a.e. and also in Norm) Choose $\varepsilon = \frac{1}{2^k}$ there exists number $N(k)$ such that $\|f_l - f_m\| < \frac{1}{2^k}$ for $l, m \geq N(k)$ for $l, m \geq N(k)$ then $\|f_{N(k)} - f_{N(k+1)}\| \leq \frac{1}{2^k}$ Define

$$G(x) = |f_{N(1)}(x)| + \sum_{k=1}^{\infty} |f_{N(k+1)}(x) - f_{N(k)}(x)|$$

then

$$\int G(x) d\mu = \int |f_{N(1)}(x)| d\mu + \sum_{k=1}^{\infty} \int |f_{N(k+1)}(x) - f_{N(k)}(x)| d\mu \leq \|f_{N(1)}\|_1 + \sum_{k=1}^{\infty} \frac{1}{2^k}$$

So, G is integrable, $\int |G(x)| d\mu < \infty$ then $G(x) < \infty$ almost everywhere. We see that for almost everywhere,

$$f_{N_1}(x) + \sum_{k=1}^{\infty} f_{N(k+1)} - f_{N(k)}(x)$$

converges for almost everywhere x , define

$$s_M(x) = f_{N(1)}(x) + f_{N(2)}(x) - f_{N(1)}(x) + \dots + f_{N(M+1)}(x) - f_{N(M)}(x) = f_{N(M+1)}(x)$$

then $s_{M-1}(x) = f_{N(M)}(x)$ and as $M \rightarrow \infty$, this converges for almost everywhere x .

$$f(x) = \lim_{M \rightarrow \infty} f_{N(M)}(x)$$

$$\begin{aligned} f(x) &= f_{N_1}(x) + \sum_{M=1}^{\infty} f_{N(M+1)}(x) - f_{N(M)}(x) \\ \int |f(x) - f_{N_1}(x)| \, d\mu &= \int \sum_{M=1}^{\infty} f_{N(M+1)}(x) - f_{N(M)}(x) \, d\mu \\ &\leq \int |f_{N(M+1)}(x) - f_{N(M)}(x)| + \int |f_{N(M+2)} - f_{N(M+1)}| + \dots \\ &= \sum_{k=M}^{\infty} \int |f_{N(k+1)}(x) - f_{N(k)}(x)| \, d\mu \\ &\leq 2^{1-M} \end{aligned}$$

This shows convergence of $f_{N(M)} \rightarrow f$ in L^1 . What happens with $l \geq N(k)$,

$$\|f_l - f\| \leq \|f_l - f_{N(k)}\| + \|f_{N(k)} - f\| \leq \frac{1}{2^k}, \rightarrow 0$$

□

L^1 or (\mathcal{L}^1) are complete, in the sense that every Cauchy sequence converges. $\{f_n\}$ cxauchy, For every $\varepsilon > 0$, there exists $N(\varepsilon)$ such that for $l, m \geq N(\varepsilon)$ then $\|f_l - f_m\| < \varepsilon$

Definition 4.1.4.

$$\|f\|_p = \left(\int |f|^p \, d\mu \right)^{\frac{1}{p}}$$

where L^p is space of equivalence class and \mathcal{L}^p is space of functions

Claim 4.1.5 — $\|f\|_p$ define norm

Proof. for any $f, g \in L^p$,

$$\begin{aligned} \int |f + g|^p \, d\mu &\leq \int (2 \max |f|, |g|)^p \, d\mu \\ &= 2 \left(\int \max |f|^p, |g|^p \right) \, d\mu \\ &\leq 2 \int |f|^p + |g|^p \, d\mu \end{aligned}$$

□

Remark 4.1.6. $\|f + g\|_p \leq 2^{\frac{1}{p}}(\|f\|_p + \|g\|_p)$
